

# PC MATIC'S WHITELIST DEFEATS WANNACRY

**Millions** of Endpoints ▶ **0** WannaCry Infections

WannaCry ransomware encrypted hundreds of thousands of endpoints all over the world in a record breaking infection spree. Exploiting a vulnerability in Windows SMB on unpatched systems after infection it easily spread to other endpoints on a network and encrypted them.

PC Matic customers saw **no infections** from this ransomware strain even with the widespread chaos it caused. Our protection is based off of our automated global whitelist which can easily stop new and unknown ransomware and malware. With a default-deny stance we only allow applications we know are good to execute on the machine. Using whitelisting is the only way to completely prevent infection from this strain and others that continue to get created and spread across the world on a daily basis.

**THE WORLD NEEDS BETTER SECURITY. WE GOT IT.**

Feel safe using our superior security software, which is researched, developed, and supported in the United States. Our product effectively stops what other products cannot by using our proprietary whitelisting technology.
